

Educational course for fire-department leading workers in the administrative region of Osnabrück

In January / February 2006 the leading workers of the voluntary fire-departments of the administrative region of Osnabrück met for their annual educational course. During two days of seminars about 100 present city-, area- and town- fire masters as well as the deputy city- and area- fire masters informed themselves about the new educational themes. Besides the themes of technical building collapse-help, MANV, dogs rescue relay and TUIS Mr. Gorski, the expert salesman responsible informed the participants about the possibilities of employment of the extinguishing device additive FIRESORB®. Besides the general fields of application and the combat principles various documented FIRESORB® combat situations were introduced. For the administrative region of Osnabrück, which is a mainly rural structured area, especially the applications in fighting forest fires, silo plants and for heat shielding in case of a fire in farms and recycling depots were of interest. At a further date in the spring 2006 the extinguishing device additive FIRESORB® will be introduced and tested in practice.
